EXPERIMENT 06

Deluge workflows, testing and debugging

Aim

Implement service-request validation, status-transition rules and a ready-for-pickup notification, and test success and failure paths.

Procedure

1. Create a workflow on Service_Request_Form: On Validate. Use your exact link names (adjust the sample below).
2. Keep validation free of email and API calls. Send notifications only after a successful save or from the button action.
3. Restrict direct editing of Vehicle_Reg_No and Request_Date after creation; enforce this server-side.
4. Create the Send_ReadyForPickup_Button function: select only records with Status 'Ready for Pickup' and a missing Pickup_Notified_On date, send one email each, set Pickup_Notified_On after success.
5. Check execution logs; use temporary info statements with record IDs only, then remove them.

```
// Service_Request_Form: On Validate (illustrative - match your link names)
if(input.Bay != null && Service_Request[Bay == input.Bay && Status != "Delivered"].count() > 0)
{
  alert "This bay is already occupied.";
  cancel submit;
}
input.Status = "Requested";
input.Request_Date = zoho.currentdate;
```

Concurrent requests can both pass this check; atomic allocation or serialization is needed for production.

Implementation and verification

Test	Condition	Expected
T01	Valid walk-in request	Saved with Status Requested
T02	Missing Vehicle_Reg_No	Rejected
T03	Bay already occupied	Rejected
T04	Inactive technician assigned	Rejected
T05	Skip stage (Requested -> Delivered)	Rejected
T06	Button clicked twice	No duplicate email
T07	Request not Ready for Pickup	No notification
T08	Board drag by unauthorized user	Denied
T09	Import/API path	Same validation applies
T10	Two simultaneous bay assignments	Document result; race blocks production

Evidence and testing

E06: script, compile screenshot, test log with actual outcomes, execution-log excerpt. Report actual results only.

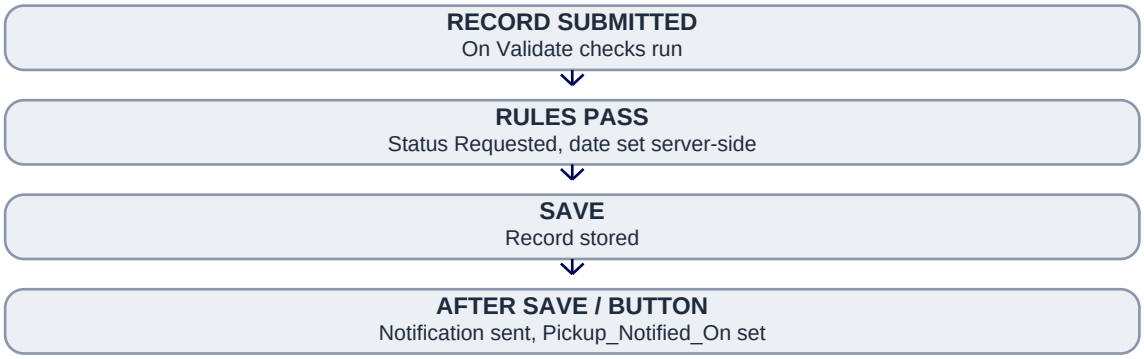
Process diagram



Generated explanatory diagram. It is not a screenshot of an executed workflow.

Result

Expected result and verification criteria. Validation, transition rules and notifications pass their tests with captured evidence. Any race condition or bypass blocks production until fixed.
