EXPERIMENT 09

Zia and built-in analytics

Aim

Evaluate available Zia assistance and Creator analytics for accuracy, privacy and account availability.

Procedure

1. Check with an administrator which Zia features your account has; do not assume availability.
2. In a development copy, ask Zia for a small validation script using a sanitized prompt (field names only, no real owner data).
3. Compare the output with your field dictionary and Experiment 6; correct and keep a correction log; compile before enabling.
4. Build native charts: service requests by type, monthly requests, status distribution. Reconcile with hand-counted fixtures.
5. If prediction is unavailable, label any AI prediction exercise 'design-only'. Do not report accuracy without a held-out evaluation.

Implementation and verification

Check	Evidence
Correctness	Generated logic vs tests T01 to T10
Privacy	No real names, phones, or plates in prompts
Analytics	Chart totals equal source records
Human control	No automatic action from unreviewed AI output

Evidence and testing

E09: feature availability record, sanitized prompt and output, human corrections, chart screenshots with reconciliation. The dashboard screenshot is native Creator analytics, not evidence of a Zia session. Reconciliation: the bar chart (P005 = 20, P004 = 7, P002 = 3) agrees with the Part Usage report (P005: 8 + 12; P004: 2 + 5; P002: 3), and each scatter point agrees with the Spare Part Inventory report (Reorder Level vs Quantity Available).

Application images and explanation

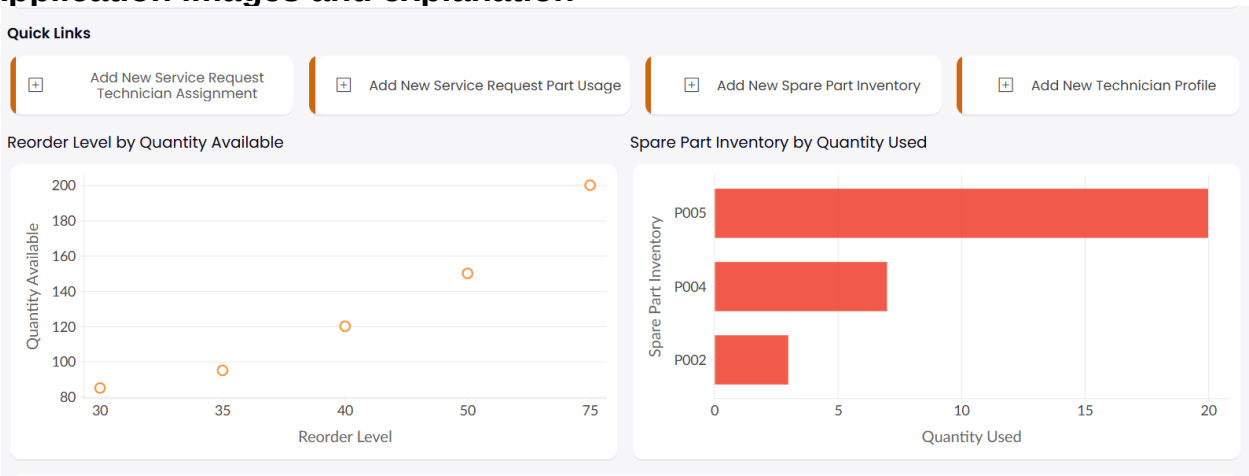

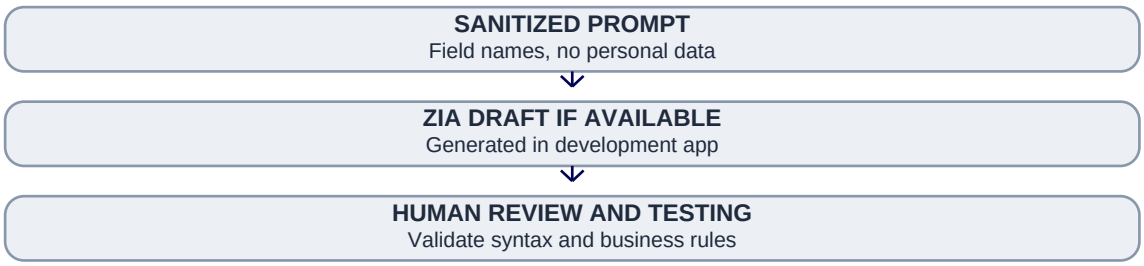

Figure 1: Application dashboard: Quick Links, Reorder Level by Quantity Available (scatter) and Spare Part Inventory by Quantity Used (bar)

Process diagram

Generated explanatory diagram. It is not a screenshot of an executed workflow.

Result

Expected result and verification criteria. Available assistance is judged against concrete tests; native metrics reconcile; unavailable features are stated.
